Why consider fertility preservation?

People choose to preserve their fertility for many reasons, including:

- **Age:** A person is born with all of the eggs they will ever have, and the quality and quantity of those eggs tend to decline with age. Sperm is produced throughout a person's life, but the health and vitality of sperm decrease as people get older. Fertility preservation at a younger age may increase the chances of a healthy pregnancy in the future.
- **Medical conditions:** Radiation, chemotherapy, hormone therapy, and some surgeries can have a negative impact on fertility. It's often possible to freeze eggs, sperm, reproductive tissue, or embryos before these treatments to protect a person's ability to have children.
- **Health conditions:** Conditions like sickle cell anemia, lupus, and rheumatoid arthritis can increase a person's risk of infertility, so fertility preservation may be recommended in some cases.
- **High-risk careers:** Exposure to radiation and toxic substances like pesticides, lead, metals, and petrochemicals may be harmful to fertility. It's also often recommended to freeze eggs, sperm, or embryos before starting a job with significant physical risks, like careers in the military and logging.

Fertility preservation with Carrot

Use your Carrot benefit to:*

- Pay for eligible care and services, such as egg, sperm, or embryo freezing and storage fees**
- Find eligible fertility clinics and cryobanks/storage facilities near you
- Talk virtually and as often as needed with Carrot medical experts and specialists about baseline testing, the fertility preservation process, what to expect, estimated costs, and more
- Order medications from Carrot Rx— an easy-to-use pharmacy (powered by Alto) that offers up to 40% savings and price matching on most fertility medications, 24/7 support from certified clinicians, and free next-day delivery
